Not illustrated. 1869 Excerpt: . . . thrust of the lower flange against the abutment is equal and opposite to the pull of the upper flange, so that they form a couple whose tendency is to overturn the abutment on its lower edge next the weight. 149. Strains In braced webs may be deduced from shearingstrain. --When the flanges are parallel and the bracing consists of a single system of triangulation, the strain in any brace is equal to the shearing-strain multiplied by  $\sec O$ . Hence the strains in the bracing might be deduced from the shearing-strain in the web calculated in the manner explained in Chap. II. (14, 18). The method of the resolution of forces just described is, however, better calculated to give a correct perception of the properties of diagonal bracing, and it has moreover the advantage of being applicable to lattice girders as well as those whose bracing consists of a single system of triangles. See the table in 236 for the numerical values of the tangents and secants of different angles. 150. Web. --Let  $W$  the weight of so much of the load as covers one bay, i. e. , the weight resting on each apex of the loaded flange (146),  $n$  the number of these weights between any given diagonal and the outer end of the girder,  $2$  the strain in the given diagonal,  $F$  the strain in any bay of either flange,  $B$  the angle which the diagonals make with a vertical line.  $W$  The weight on...
